

Alfacaïne 2%+ adrenaline

Composition:

Each ml solution contains:

20 mg lidocaine HCl

10 mcg adrenaline (as bitartrate)

Action:

Lidocaine is a hydro soluble anaesthetic with quick local action (in a couple of minutes). This local anaesthesia may last for half an hour up to a couple of hours, depending on dosage and concentration.

Adrenaline is added because of its vasoconstrictive Action: it prolongs the anaesthesia and diminishes the risk of secondary effects. If not overdosed the toxicity of lidocaine is very low.

Indications:

Local anaesthesia of the skin, the mucous membranes, muscles, etc.

Pre- or post-operative anaesthesia, tooth extractions, dehorning, wound suturing, prevention of excessive bleeding, etc.

Administration:

By subcutaneous, intramuscular, intra/peri-articular or epidural injection.

Depending on injection site, surface area and method of **Administration:** 3-5 ml (low dose) up to 20 ml (high dose, e.g. in order to treat the animal in lying position).

Advised withdrawal times:

milk : none

meat : none

Warning:

Do not administer iv

Conservation:

Cool (8-15°C), protected from light.

Presentation:

Per 12 vials of 100 ml.

6 vials of 250 ml.
